

# **Engineering Core**

**Assignment 2: Business Performance Dashboards**

**EN6001**

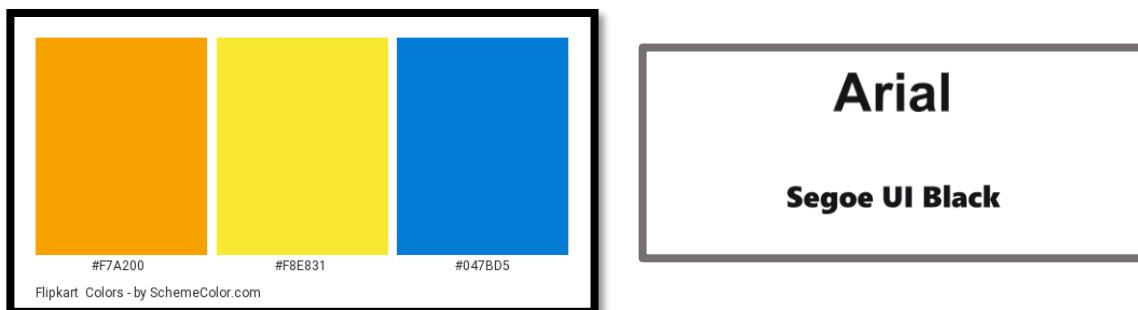

**Assignment-2**

**Sheikh Muhammed Tadeeb (AU19B1014)**

## ❖ Problem-Statement:

Students will study the data sets given. Based on the data set student will deliver the business requirements in the form of a dashboard with complete navigation. (Students will understand the business requirements). All Viz (visualization) should be filtered on Year of Order Date.

## ❖ Color-Theme & Typography Chosen:

## ❖ Logo-Chosen:

### 1) Create a Dashboard following Vizs

- V1-Top 10 Products by Sale – Show Product Name, Sale and % Contribution to Total Sale in Tooltip.

#### Solution:

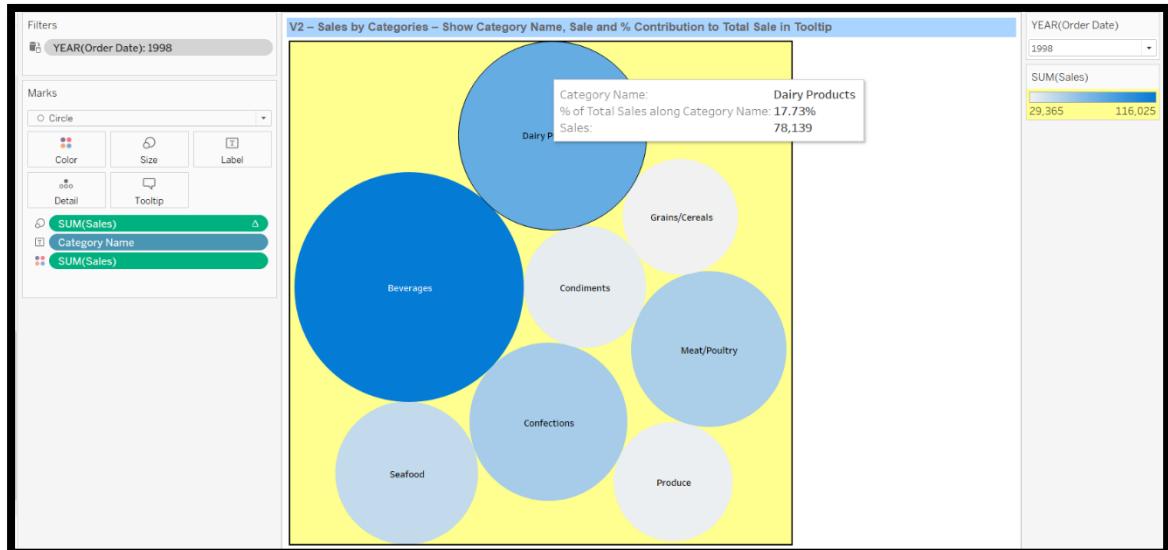

**Inference:** In table calculation of sales, I have defined rank as descending and Unique to get top products, to define a fixed value 10, I put the sum(sales) in filter and filtered for just top 10 values.

The screenshot shows the Tableau interface with four windows:

- Table Calculation:** Shows "Rank" as the calculation type, "Descending" as the order, and "Unique (1, 2, 3, 4)" as the uniqueness setting. "Compute Using" is set to "Table (across)". "Marks" are set to "Color" and "Size". A calculated field `V1_%Contri_ToTotalSales` is being created with the formula `(SUM([Sales])/TOTAL(SUM([Sales]))) * 100`.
- Filter [Rank of Sales]:** A dialog box where "Range of values" is set from 1 to 10. The "OK" button is highlighted.
- Calculated Field:** A dialog box for `V1_%Contri_ToTotalSales` showing the formula `(SUM([Sales])/TOTAL(SUM([Sales]))) * 100`. It indicates "The calculation is valid." and has "Default Table Calculation" and "OK" buttons.
- Dashboard Preview:** Shows a bubble chart of sales by category. The largest bubble is for Beverages, followed by Dairy Products, Meat/Poultry, and Confections. A tooltip for the Dairy Products bubble displays the category name, percentage contribution to total sales (17.73%), and sales value (78,139).

- V2-Sales by Categories – Show Category Name, Sale and % Contribution to Total Sale in Tooltip

### Solution:

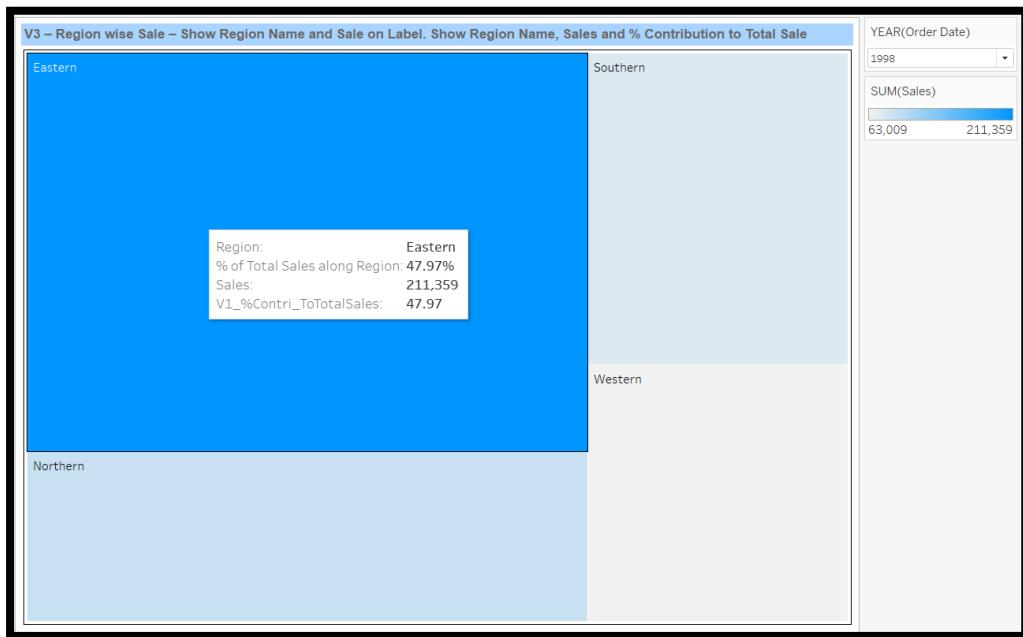

**Inference:** Here Beverage category has the highest sales and it constitutes around 26.33 % of the total sales. The least sales are of grain/cereal category. For Percentage contribution to total sales, I have made a calculated field and used the formula given below. In percentage calculation to total sales has been done on “Category” in edit table calculation.

`(SUM([Sales])/TOTAL(SUM([Sales]))) * 100`

- V3-Region wise Sale – Show Region Name and Sale on Label. Show Region Name, Sales and % Contribution to Total Sale.

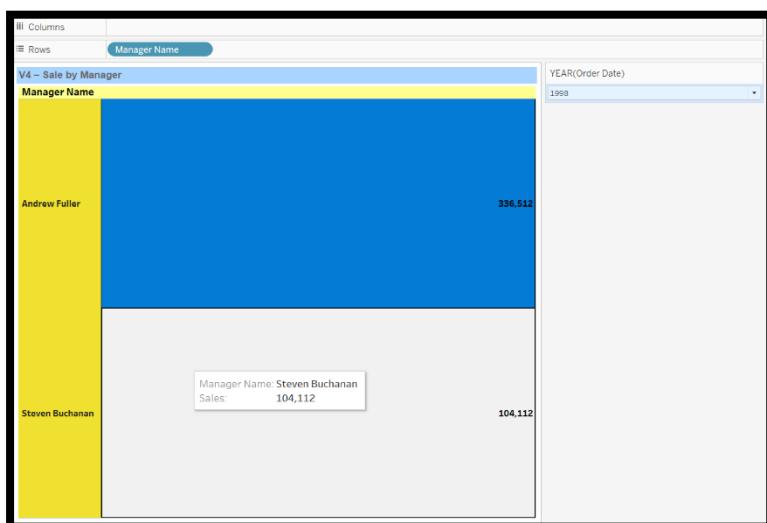

**Solution:**

**Inference:** Here the highest sales are from Eastern region in year 1998 and the lowest are in western region. In percentage calculation to total sales has been done on “Region” in edit table calculation.

- V4 – Sale by Manager

**Solution:**

**Inference:** There are only 2 managers and here we have plotted their sales with a filter on year along with the labels too.

- V5 – Sale by Employee – Employee's sale should be highlighted when user hovers over the Manager Name in V4. Show % Contribution to Total Sale and % Contribution to Team Sale along with Manager Name.

### Solution:

**Inference:** Here we have found sales by different employee and put their manager's name is label. To find the contribution to total sales we have used the same formula as used in V2 i.e.

$$(\text{SUM}([\text{Sales}])/\text{TOTAL}(\text{SUM}([\text{Sales}]))) * 100$$

But this has been applied “Table Across” and to find the contribution to team sales we need to find it for “Specific dimension. i.e., Employee Name”.

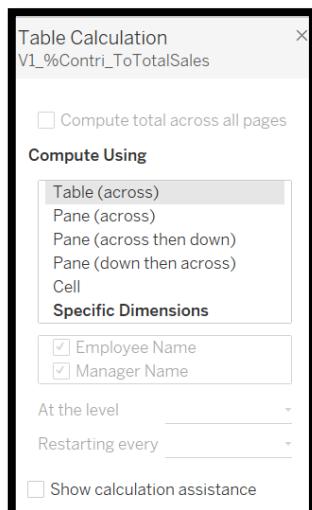

Table Calculation for Total sales

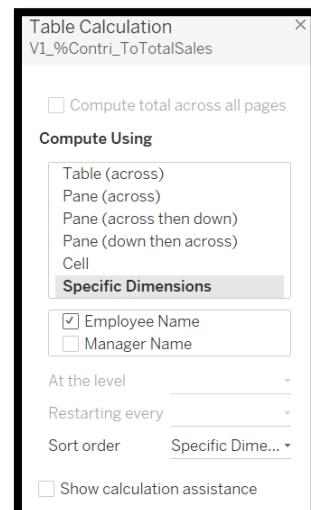

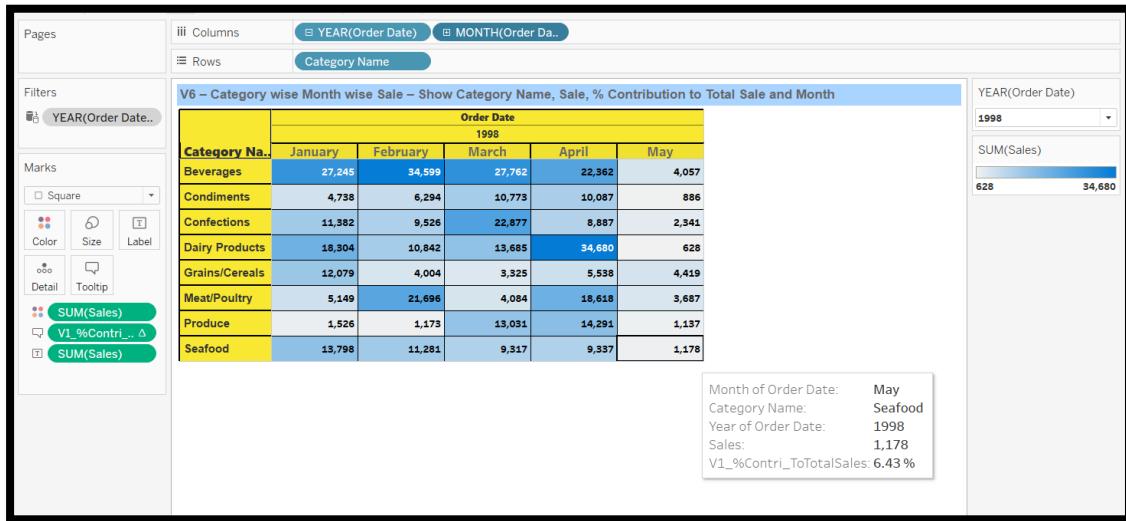

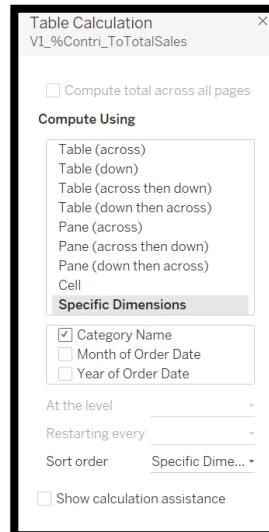

Table Calculation for Team sales

- V6 – Category wise Month wise Sale – Show Category Name, Sale, % Contribution to Total Sale and Month

**Solution:**

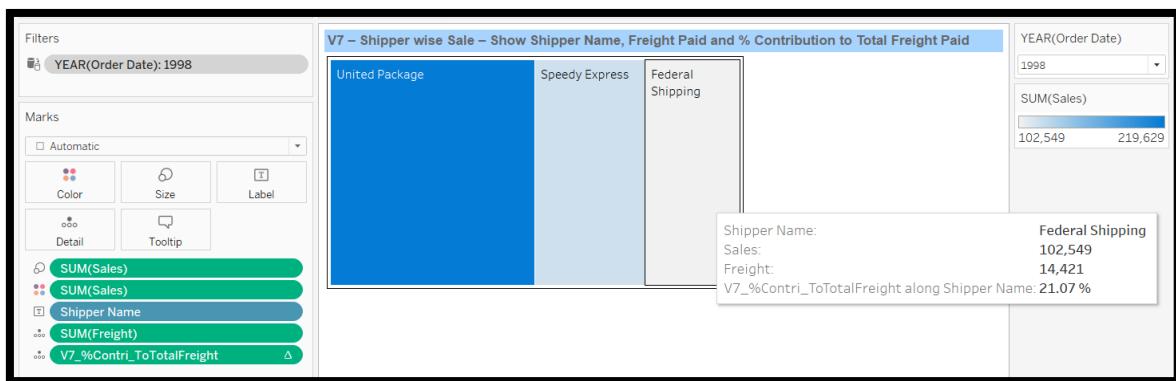

**Inference:** Here we found the category wise month wise sales based on year filter and to show percentage contribution to total sales we have found it category wise by going in edit table calculations and selecting specific dimension then category.

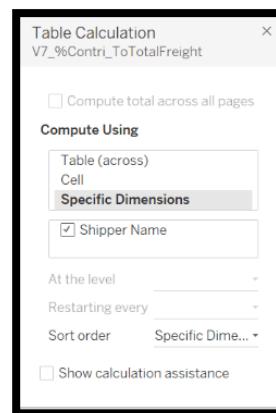

- V7–Shipper wise Sale – Show Shipper Name, Freight Paid and % Contribution to Total Freight Paid

**Solution:**

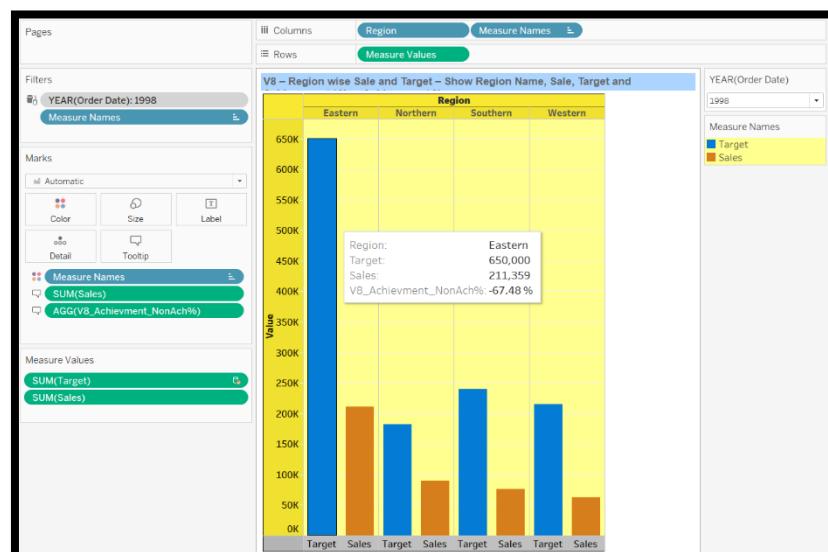

**Inference:** Here we found the Shipper sales based on year filter and to show percentage contribution to total sales we have found it shipper wise by going in edit table calculations and selecting specific dimension then shipper name. Showed them in label.

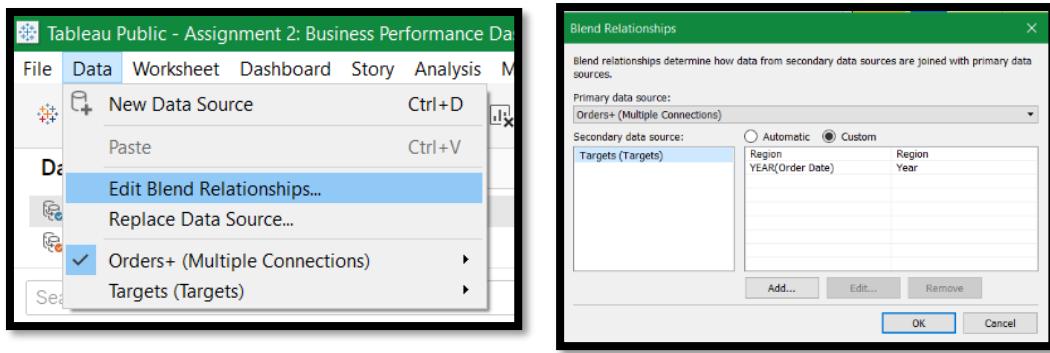

- V8 - Region wise Sale and Target – Show Region Name, Sale, Target and Achievement / Non-Achievement %.

### Solution:

**Inference:** Here we needed target sales values but it was in Target excel sheet which we can't be joined with orders database as it was not having any direct inter-relation with orders sheet but was connected to employee sheet. Even though it shared a common column with employee sheet we can't use joins as not all values were there in common column. So, we have used the concept of data-blending.

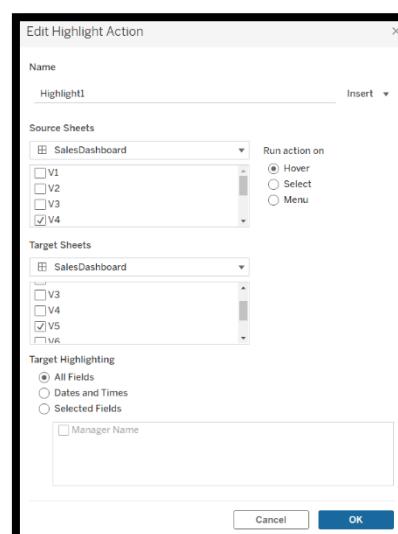

For Finding the achievement and non-achievement percentage I have use the below formula in table calculations.

## ❖ V5- Hovering part:

I have used Highlighter option of tableau for this purpose.

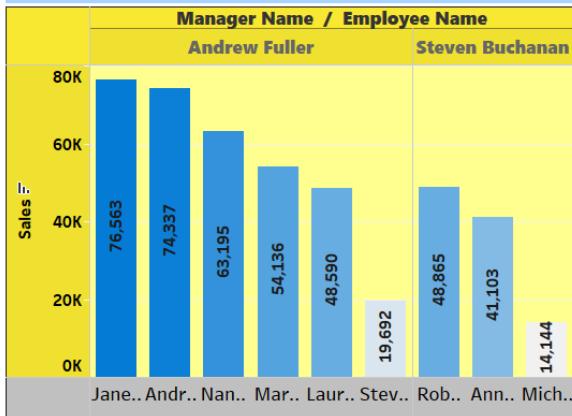

# Sales Dashboard

## Flipcart Market Analysis (Dashboard-1)

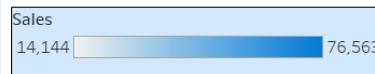

[Go to Category Dashboard](#)
[Go to Analytical Dashboard](#)
[Go to Product Dashboard](#)

V5 – Sale by Employee – Employees sale should be highlighted when user hovers over the Manager Name in V4. Show % Contribution to Total Sale and % Contribution to Team Sale along with Manager Name

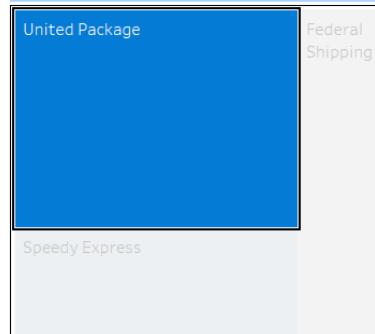

V6 – Category wise Month wise Sale – Show Category Name, Sale, % Contribution to Total Sale and Month

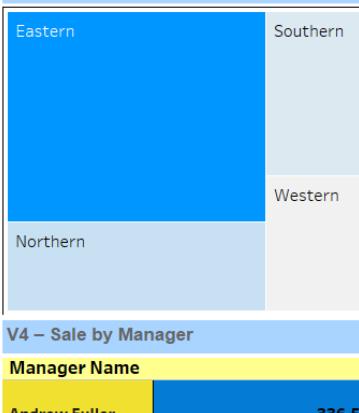

Category	Order Date				
	January	February	March	April	May
Beverages	27,245	34,599	27,762	22,362	4,057
Condiments	4,738	6,294	10,773	10,087	886
Confections	11,382	9,526	22,877	8,887	2,341
Dairy Products	18,304	10,842	13,685	34,680	628
Grains/Cereals	12,079	4,004	3,325	5,538	4,419
Meat/Poultry	5,149	21,696	4,084	18,618	3,687
Produce	1,526	1,173	13,031	14,291	1,137
Seafood	13,798	11,281	9,317	9,337	1,178

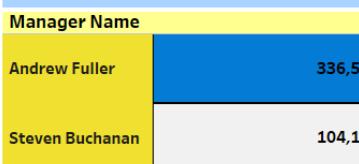

V7 – Shipper wise Sale – Show Shipper Name, Freight Paid and % Contribution to Total Freight Paid

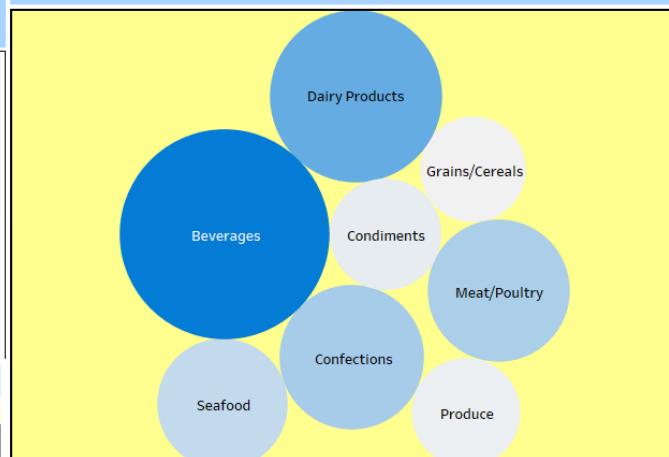

V3 – Region wise Sale – Show Region Name and Sale on Label. Show Region Name, Sales and % Contribution to Total Sale

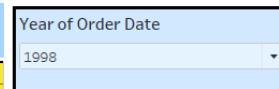

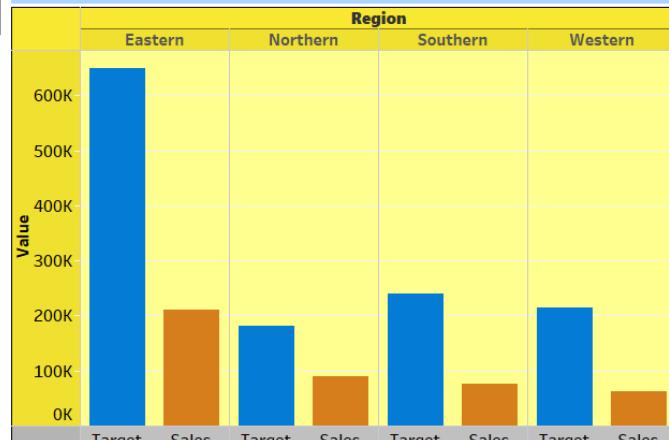

V4 – Sale by Manager

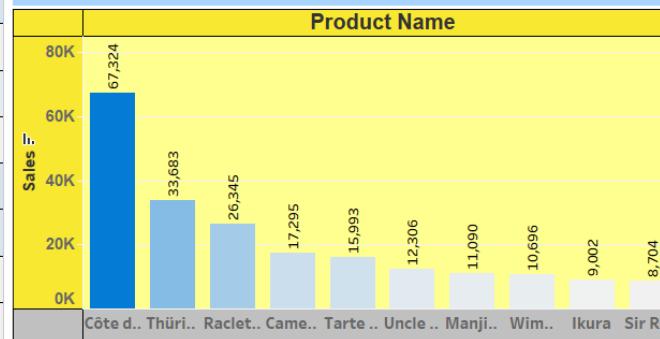

V2 – Sales by Categories – Show Category Name, Sale and % Contribution to Total Sale in Tooltip

V8 – Region wise Sale and Target – Show Region Name, Sale, Target and Achievement / Non-Achievement %

V1 – Top 10 Products by Sale – Show Product Name, Sale and % Contribution to Total Sale in Tooltip

# Sales Dashboard

(Part of V5-With Hovering effect on employee when hovered on their Manager's name)

Confections  
Seafood  
Produce

**2) When clicked on Product Name in V1, user should go to a ‘Product Dashboard’ consisting of :**

**2A) Ship Country wise Sale**

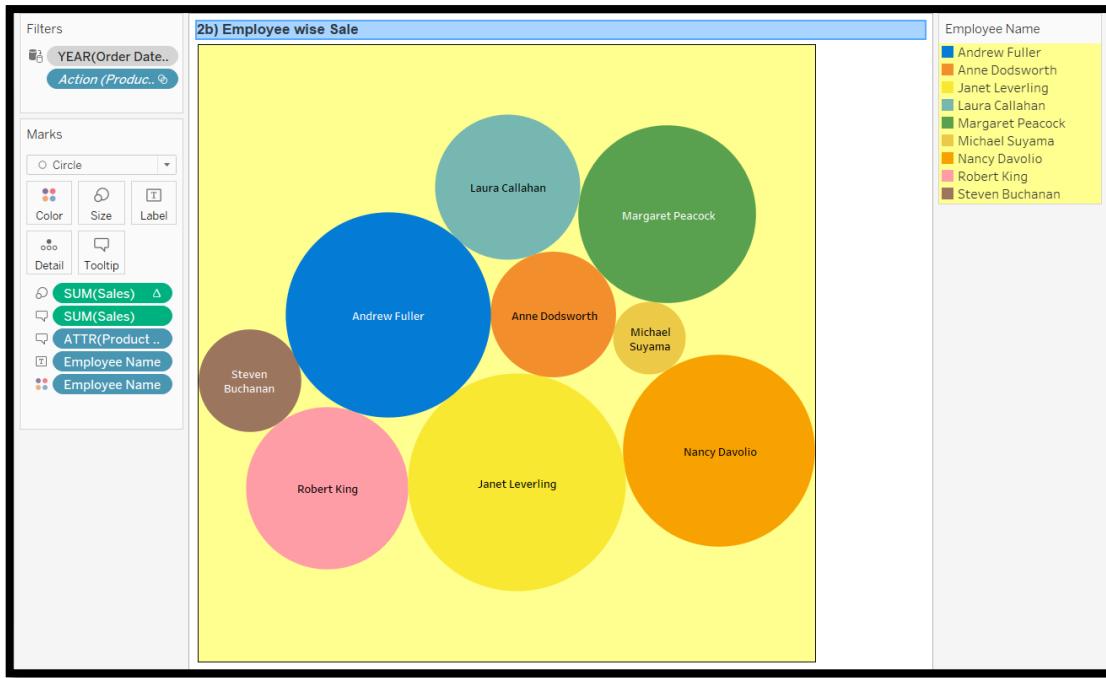

**Solution:**

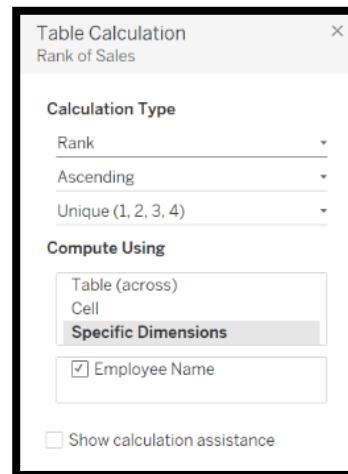

**Inference:** Here we need to find ship-country wise sales for that I have used this map visualisation as the nos of countries were less in all the years in filter plus it gave a direct understanding to the user that which country is having how much sales for a particular product.

**2B) Employee wise Sale**

**Solution:**

**Inference:** Here we need to find employee wise sales for that I have used this bubble-chart visualisation as the nos of employees were less in all the years in filter plus it gave a direct understanding to the user that which employee is having how much sales for a particular product in descending order just by looking at bubble size. Table calculations are done along employee name.

**2C)** Table Consisting of Employee Name, Order Id, Potential Sale, Actual Sale, Opportunity Loss %. Add the Subtotal and Grand Total

**Solution:**

2c) Table Consisting of Employee Name, Order Id, Potential Sale, Actual Sale, Opportunity Loss %. Add the Subtotal and Grand Total

Employee..	Order ID	OpportunityLoss%	PotentialSales	Sales
Robert King	11006	23	16,322	12,615
	11030	10	3,592	3,233
	11033	0	60	60
	11037	25	1,091	818
	11047	0	525	525
	11048	20	45	36
	11051	0	1,728	1,728
	11055	0	929	929
	11066	5	244	232
	<b>Total</b>	<b>14</b>	<b>56,502</b>	<b>48,865</b>
Steven Buchanan	10812	9	1,852	1,693
	10823	9	3,108	2,826
	10841	0	4,581	4,581
	10851	5	2,740	2,603
	10866	25	1,462	1,096
	10869	0	1,630	1,630
	10870	0	160	160
	10872	5	2,167	2,058
	10874	0	310	310
	10899	15	144	122
	10922	0	743	743
	10954	13	1,902	1,660
	11043	0	210	210
	<b>Total</b>	<b>6</b>	<b>21,008</b>	<b>19,692</b>
	<b>Grand Total</b>	<b>6</b>	<b>469,771</b>	<b>440,624</b>

**Inference:** Here we need to make a table consisting of employee name, order id, Potential sale, Actual sale and opportunity loss. We also need to find total and Grand total of each employee section. For finding totals and subtotals I have used inbuild functionality of tableau in “Analytics section” & For calculating the potential sale and opportunity loss %, I have made calculated fields with the following formulas:

PotentialSales  
Orders+ (Multiple Connections)

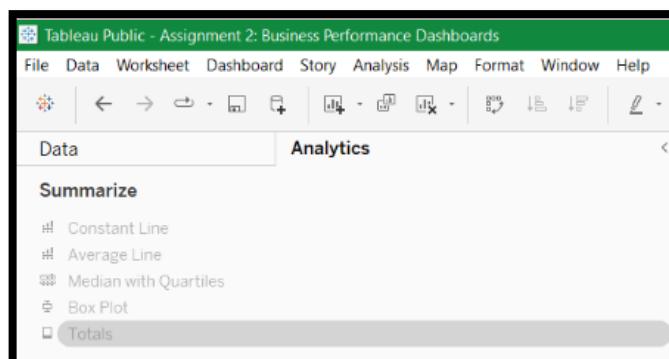

```
([Quantity]*[Unit Price])
```

The calculation is valid.

OpportunityLoss%  
Orders+ (Multiple Connections)

```
((SUM([PotentialSales])-SUM([Sales]))/SUM([PotentialSales]))*100
```

The calculation is valid.

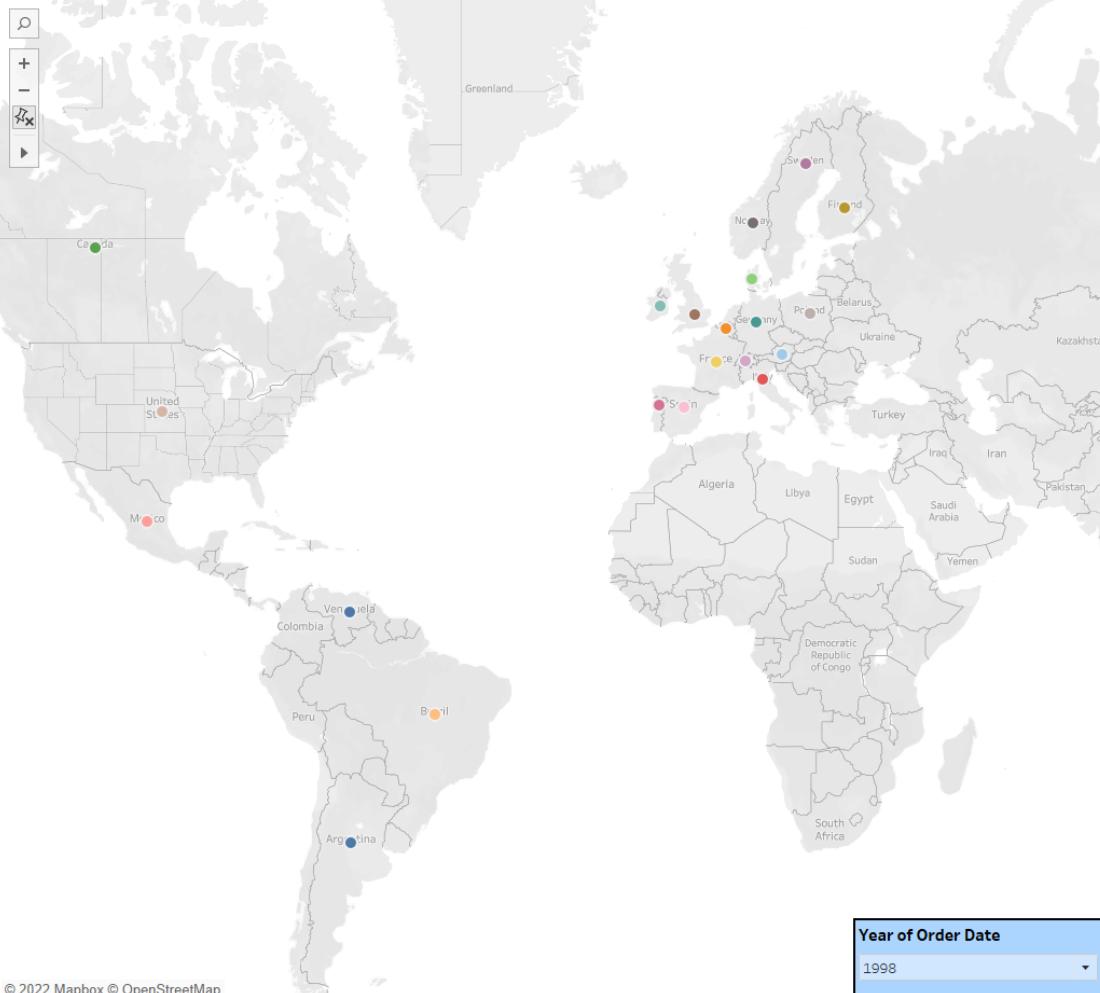

# Product Dashboard

	10949	0	4,422	4,422
	10967	0	910	910
	10971	0	1,733	1,733
10982	0	1,044	1,044	

**2c) Table Consisting of Employee Name, Order Id, Potential Sale, Actual Sale, Opportunity Loss %. Add the Subtotal and Grand Total**

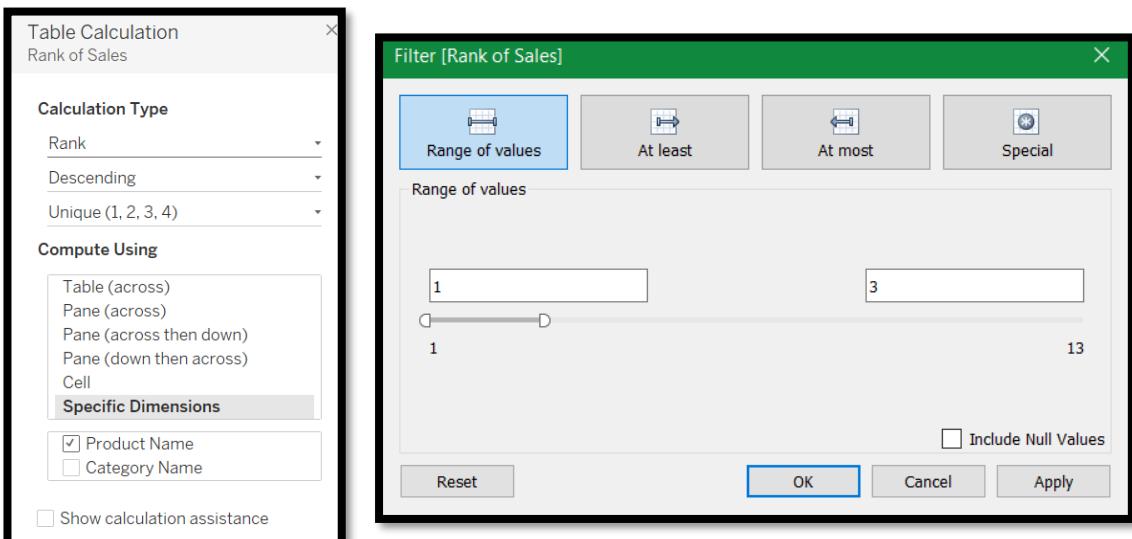

3) When clicked on Category Name in V2, user should just go ‘Category Dashboard’ consisting of –

3A) Top 3 Products by Sale in each Category

**Solution:**

**Inference:** Here we need to find top 3 products by sales in each category for that I first found all the sales in all the categories then I used table calculations to rank sales based on product name in each category descending wise with unique values and filtered the sales with only 3 values.

### 3B) Bottom 3 Products by Sale in each Category

**Solution:**

**Inference:** Here we need to find bottom 3 products by sales in each category for that I first found all the sales in all the categories then I used table calculations to rank sales based on product name in each category ascending wise with unique values and filtered the sales with only 3 values.

### 3C) Top 5 Cities by Sale in each Category

**Solution:**

**Inference:** Here we need to find top 5 cities by sales in each category for that I first found all the sales in all the categories then I used table calculations to rank sales based on ship city in each category ascending wise with unique values and filtered the sales with only 5 values.

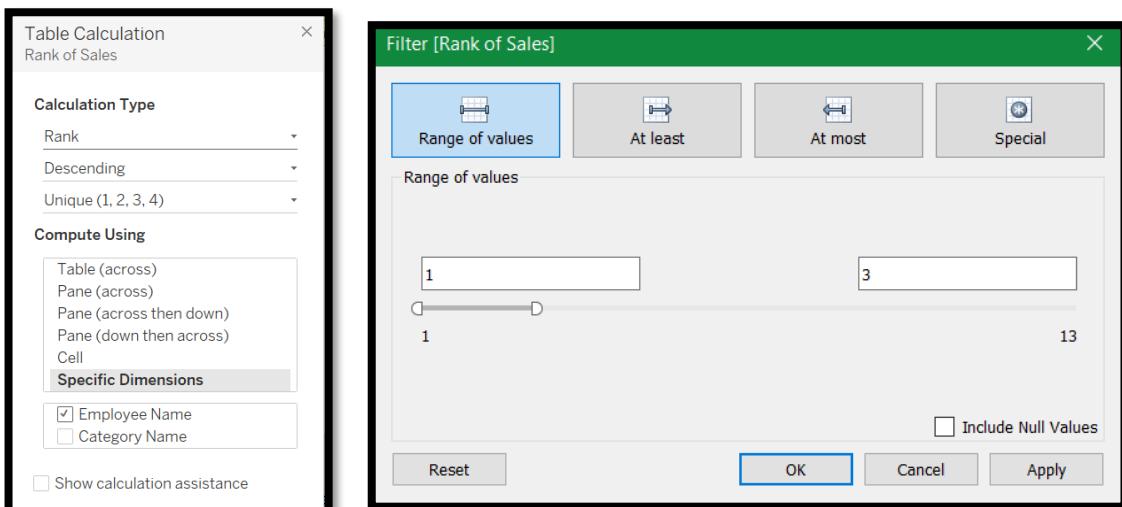

### 3D) Top 3 Employees by Sale in each Category

**Solution:**

**Inference:** Here we need to find top 3 employees by sales in each category for that I first found all the sales in all the categories then I used table calculations to rank sales based on employees in each category descending wise with unique values and filtered the sales with only 3 values.

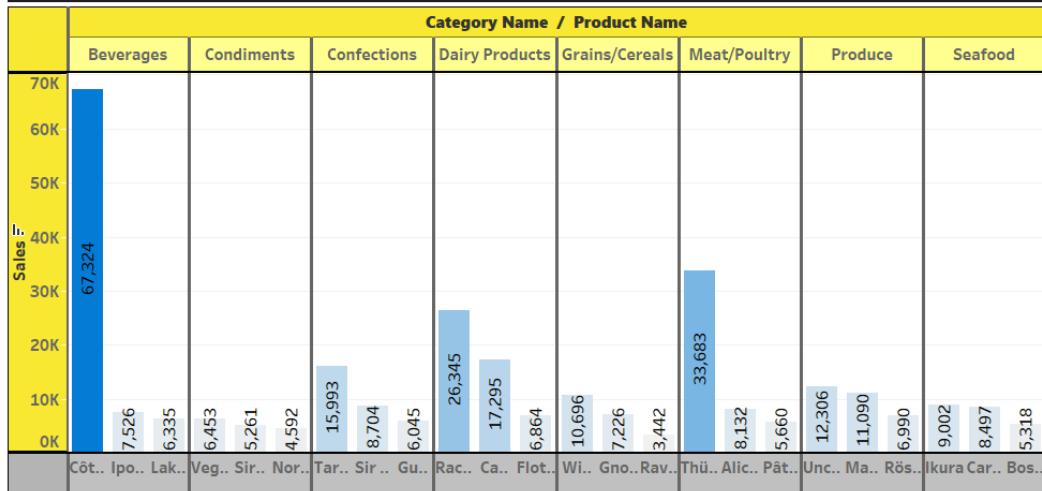

# Category Dashboard

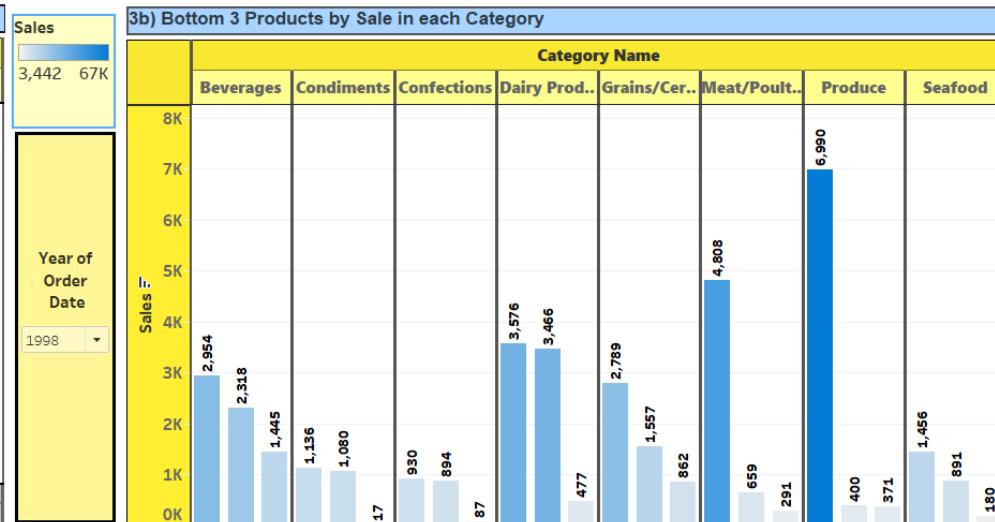

## Flipcart Category Performance Dashboard

[Go to Product Dashboard](#)
[Go to Sales Dashboard](#)
[Go to Analytical Dashboard](#)

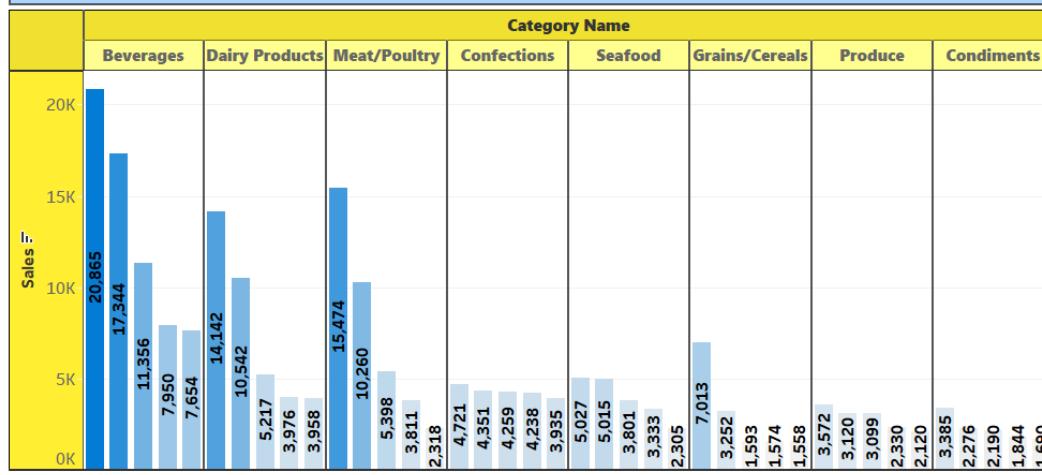

### 3a) Top 3 Products by Sale in each Category

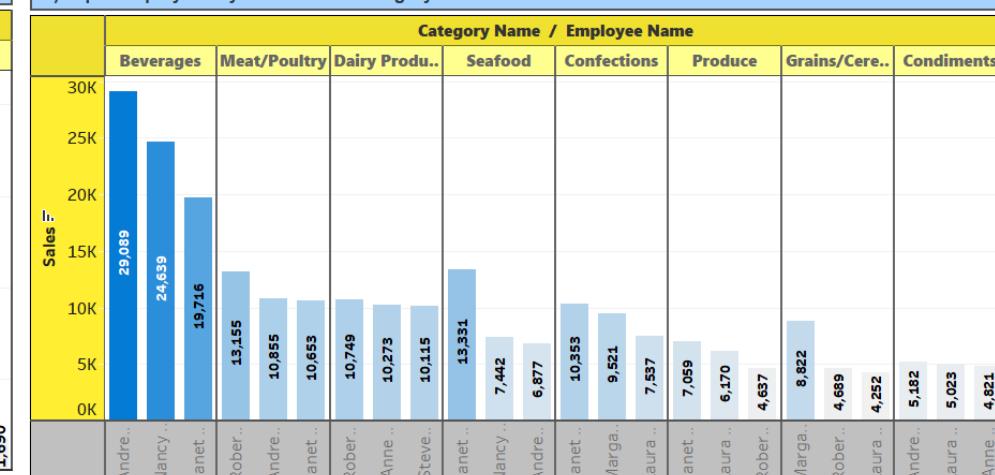

### 3b) Bottom 3 Products by Sale in each Category

### 3c) Top 5 Cities by Sale in each Category

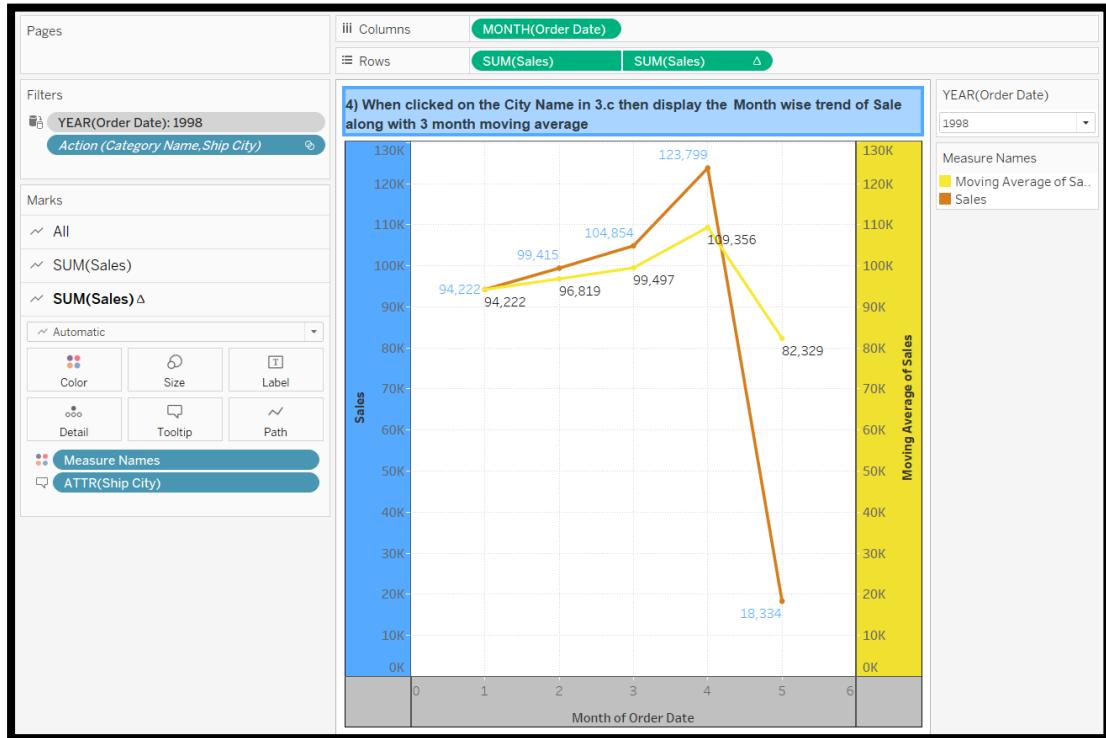

### 3d) Top 3 Employees by Sale in each Category

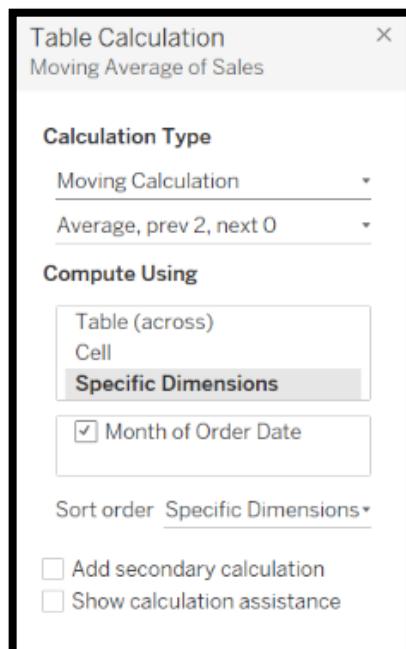

- 4) When clicked on the City Name in 3.c then display the Month wise trend of Sale along with 3 month moving average.

**Solution:**

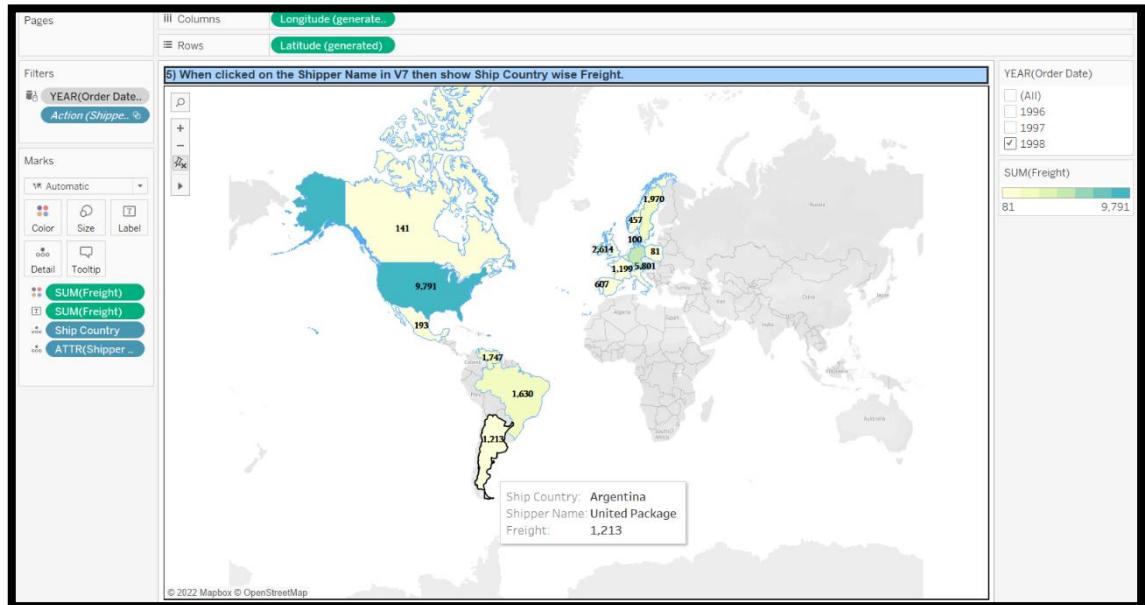

**Inference:** Here we need to find Month wise trend of sale and 3 month moving average for a clicked city. In order to find month wise moving average, I took another sum(sales) field and in its table calculation dd the following:

- 5) When clicked on the Shipper Name in V7 then show Ship Country wise Freight.

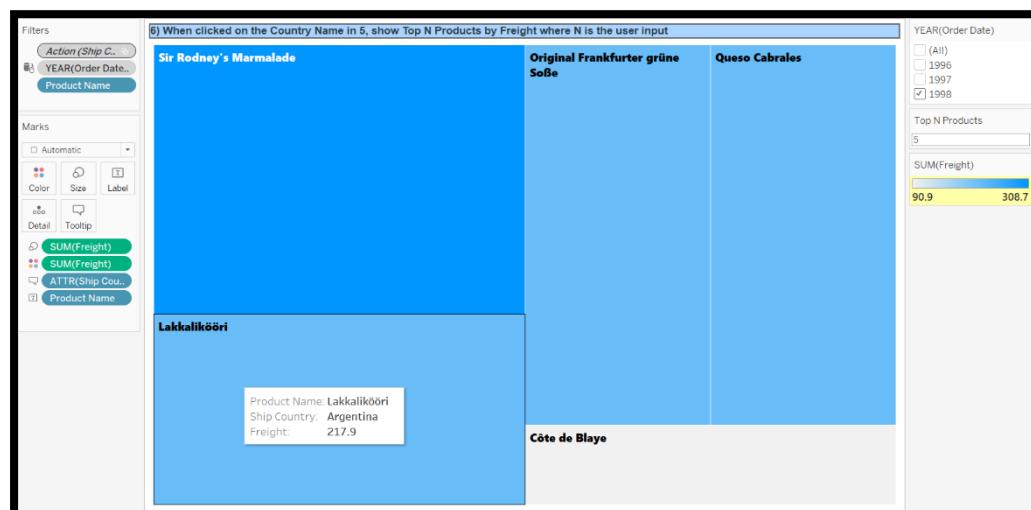

**Solution:**

**Inference:** Here we need to find Ship Country wise freight for this I have used Map visualisation as the user gets direct sense of the country and freight to that country at first glance.

- 6) When clicked on the Country Name in 5, show Top N Products by Freight where N is the user input.

**Solution:**

**Inference:** In order to show top n products by freight I created a parameter and for this parameter to work I added Action(ShipCountry) in “Add to Context”

- 7) When clicked on the Shipper Name in V7 then show Employee wise Freight. Display the Average Freight per Employee. colour code the Employees as Red if their Freight is above the average per employee else colour code them Green.

### Solution:

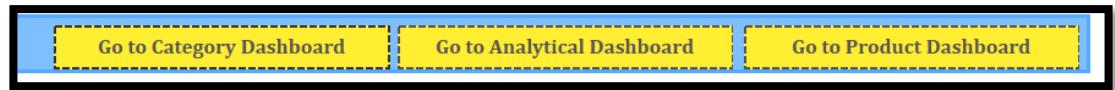

**Inference:** Here we need to find employee wise freight and average freight per employee. For this first I have changed table calculations for finding freight per employee then I have created a calculated field and used window average formula on freight.

The screenshot shows the Tableau calculation editor. The formula is defined as `WINDOW_AVG(SUM([Freight]))`. The right panel displays the documentation for the `WINDOW_AVG` function, which states it calculates the average of an expression over a specified window. The calculation is marked as valid.

The dialog shows the configuration for the "AvgFreightPerEmployee" table calculation. It uses "Specific Dimensions" and "Employee Name" as the compute using dimension. The "At the level" option is selected. The "Sort order" is set to "Specific Dimension". The "Show calculation assistance" checkbox is unchecked.

**8) Create a Button in ‘Sales Dashboard’ to navigate to the Analytical Dashboard.**

**Solution:**

**Inference:** I have used inbuild functionality of tableau for this purpose i.e. “Navigation” field.

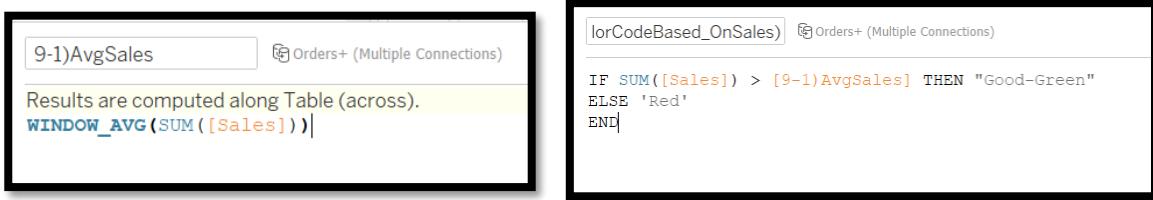

**9) Create ‘Analytical Dashboard’ comprising of –**

- 9.1) Category wise Sale – Draw average line and color code the category names as red or green depending on whether their sale is less or greater than the plotted average line.**

**Solution:**

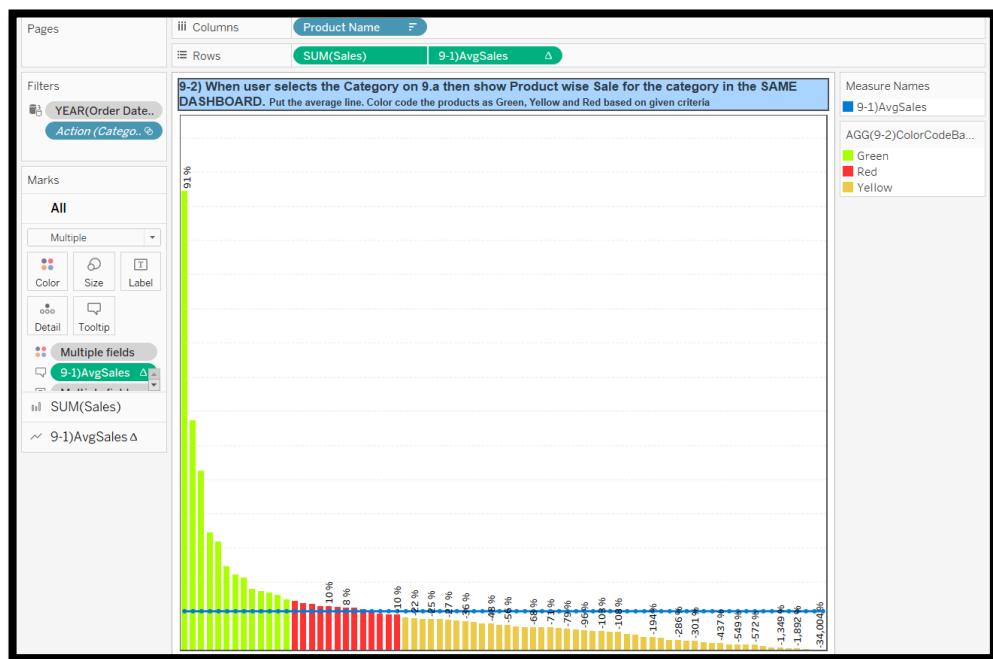

**Inference:** Here we need to find category wise sales and average sales and based on average sales we need to colour code the graph. I have created calculate fields for finding average and colour coding and used the following formulas: -

**9-2)** When user selects the Category on 9.a then show Product wise Sale for the category in the SAME DASHBOARD. Put the average line. Color code the products as Green, Yellow and Red based on following criteria –

- If the Sale is 25% above the average value, then Green
- IF the Sale is 10% below the average value, then Red
- All other columns Yellow
- On the label show the difference between the Product's Sale and Average Sale per product in % terms.

### Solution:

**Inference:** Here we need to find product-wise sales for a selected category and put the average line. For average line I used the same average calculated field used in 9-1 and for colour code and percentage difference of Product sale and average sale I created another calculated fields with the following code: -

```

ColorCodeBased_OnSales [Orders+ (Multiple Connections)]
Results are computed along Table (across).
IF SUM([Sales]) > WINDOW_AVG(SUM([Sales])) + (WINDOW_AVG(SUM([Sales])) * 0.25) THEN 'Green'
ELSEIF SUM([Sales]) < WINDOW_AVG(SUM([Sales])) - (WINDOW_AVG(SUM([Sales])) * 0.1) THEN 'Red'
ELSE 'Yellow'
END

The calculation is valid.

```

Default Table Calculation  
2 Dependencies ▾ Apply OK

```

9-2) Part 4 [Orders+ (Multiple Connections)]
Results are computed along Table (across).
((SUM([Sales]) - WINDOW_AVG(SUM([Sales]))) / SUM([Sales])) * 100

The calculation is valid.

```

Default Table Calculation  
2 Dependencies ▾ Apply OK

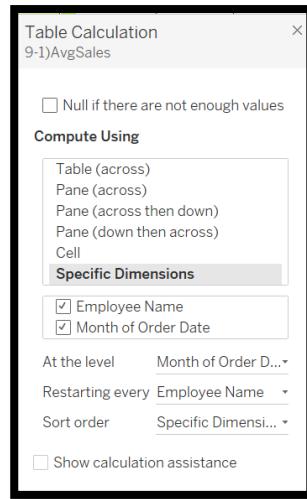

### 9-3) Employee wise Month wise Sale. Display Average Sale per Month for each Employee. colour Code Months as below

- If the sale 50% above the average value, then Green.
- If the sale is less than the average value, then Red
- Else Yellow

#### Solution:

**Inference:** Here we need to find employee wise sales and Average sales per month for each employee so I used same average calculated field created in 9-1 but here in its table calculation I defined month wise for each employee.

For colour code I have created a separate calculated field with the following code: -

```

IF SUM([Sales]) > [9-1]AvgSales] + ([9-1]AvgSales] * 0.5) THEN 'Green'
ELSEIF SUM([Sales]) < [9-1]AvgSales] THEN 'RED'
ELSE 'Yellow'
END

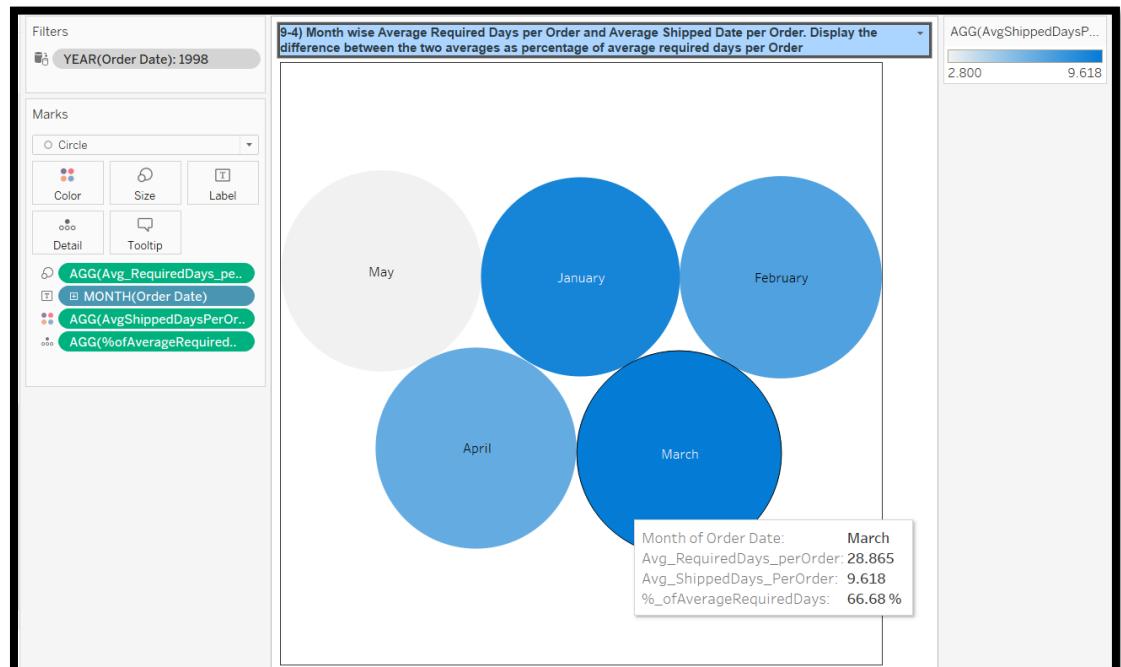

```

The calculation is valid.

2 Dependencies

#### 9-4) Month wise Average Required Days per Order and Average Shipped Date per Order. Display the difference between the two averages as percentage of average required days per Order.

**Solution:**

**Inference:** Here we need to find Month wise average required days per order and average shipped days per order, for calculating averages we first need to extract required days per order from required date and shipped days per order from shipped date, so I created two calculated fields with the following code:-

The calculation is valid.

4 Dependencies Apply OK

DATEDIFF(date\_part, start\_date, end\_date, [start\_of\_week])

Returns the difference between two dates where start\_date is subtracted from end\_date. The difference is expressed in units of date\_part. If start\_of\_week is omitted, the week

The calculation is valid.

4 Dependencies Apply OK

DATEDIFF('day',[Order Date],[Shipped Date])|

Now for calculating the averages of the required days and shipped days I made another 2 calculated fields with the following code: -

The calculation is valid.

3 Dependencies Apply OK

AVG(expression)

Returns the average of all the values in the expression. AVG can be used with numeric fields only. Null values are ignored.

Example: AVG([Profit])

The calculation is valid.

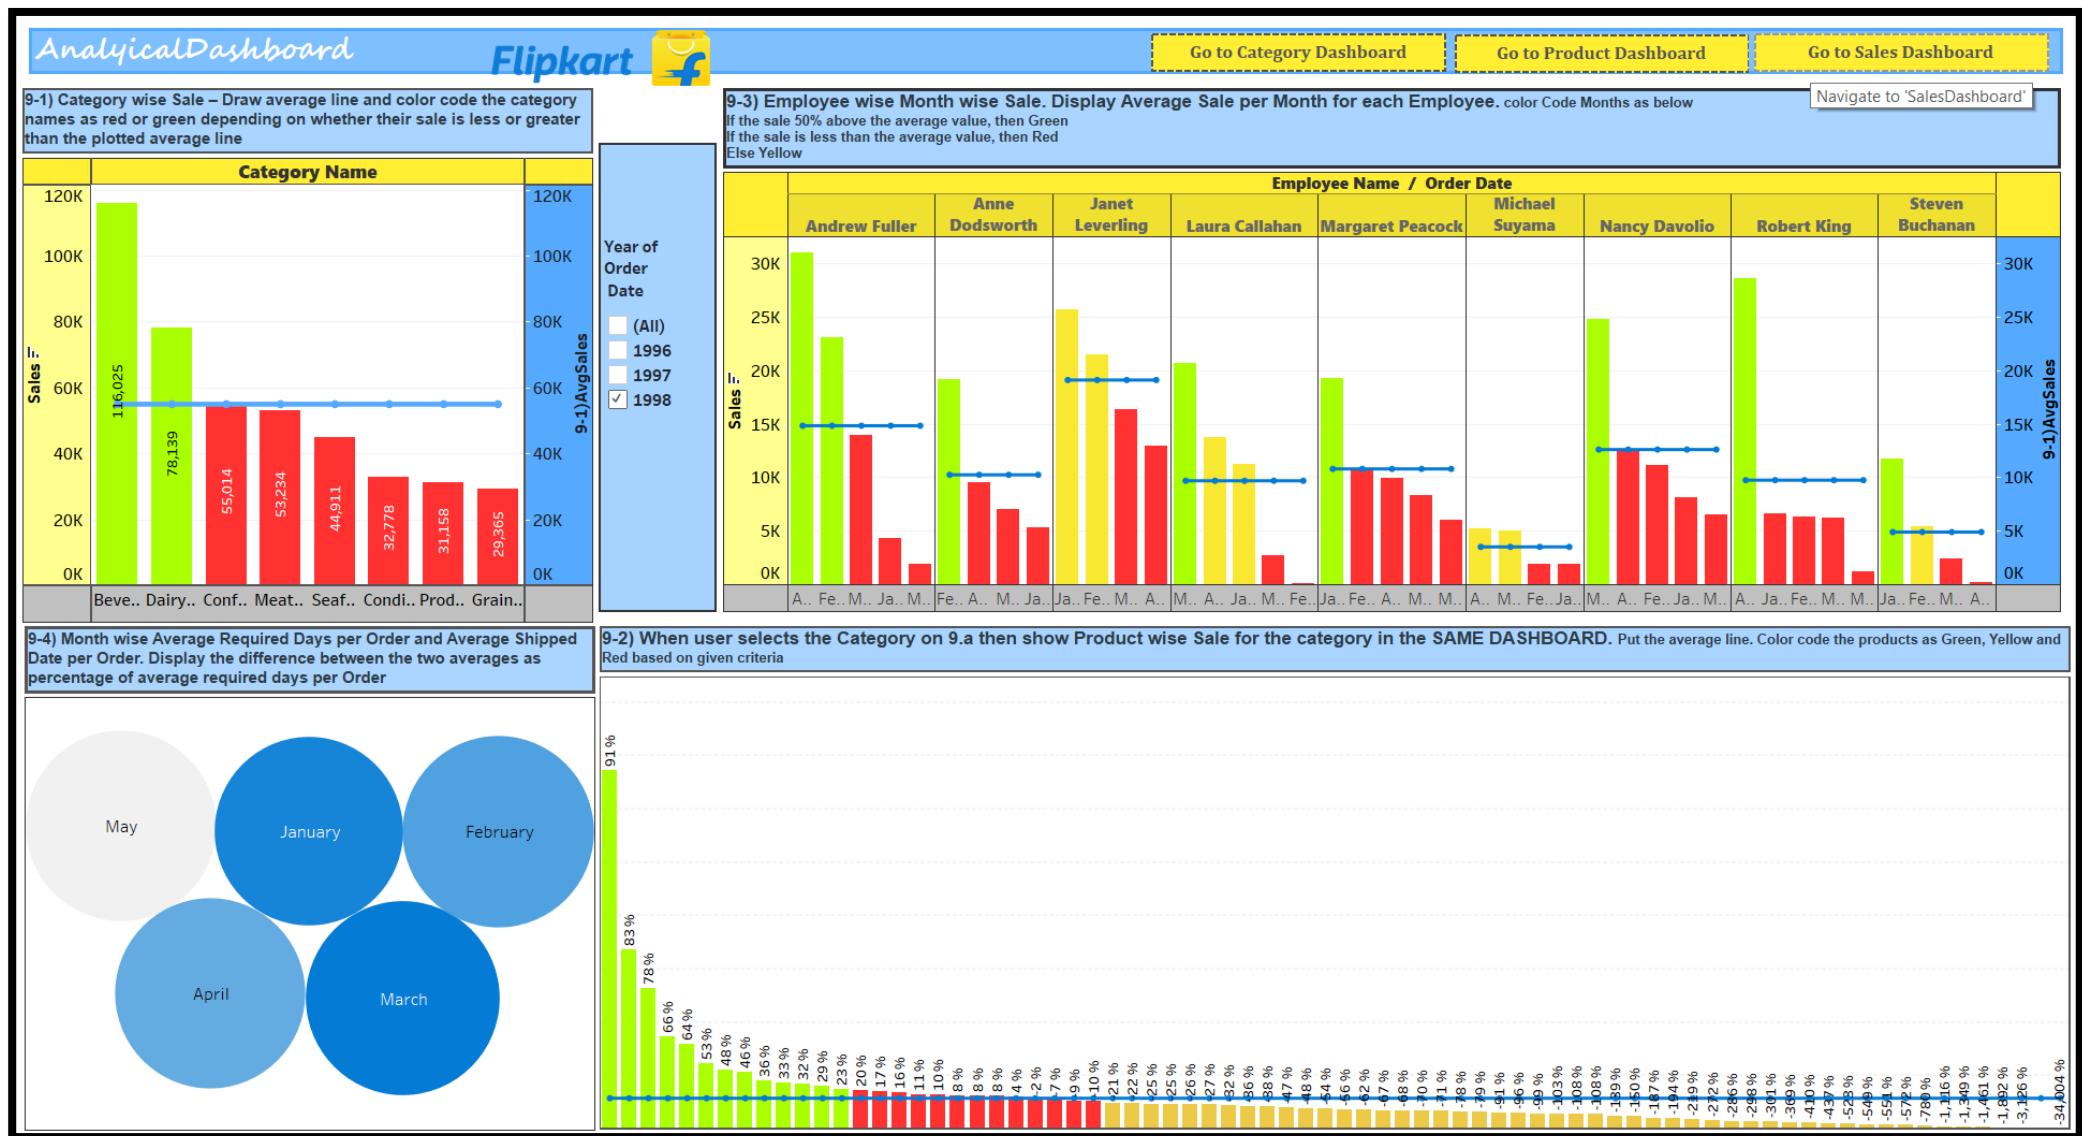

3 Dependencies Apply OK

AVG(expression)

Returns the average of all the values in the expression. AVG can be used with numeric fields only. Null values are ignored.

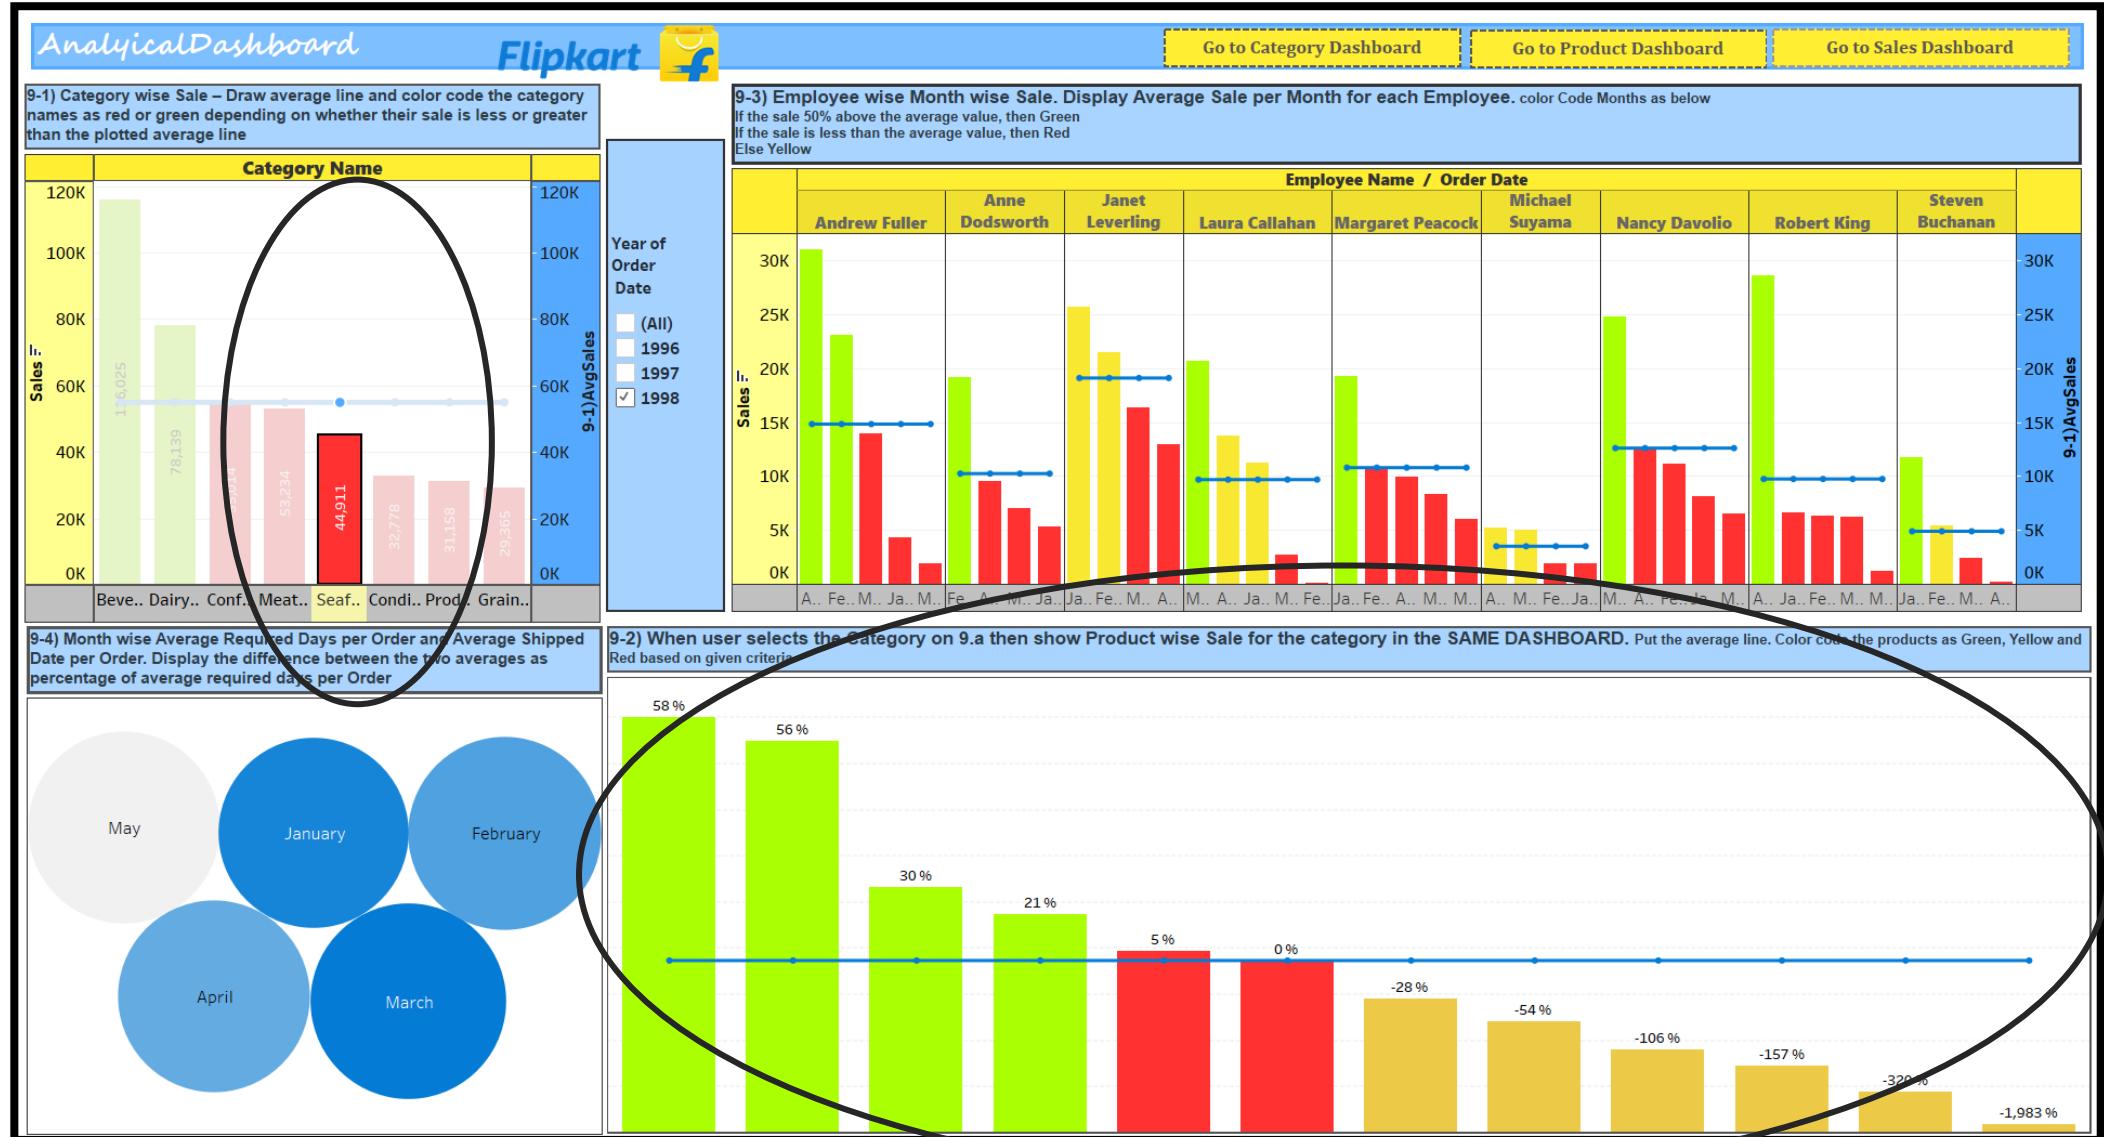

Example: AVG([Profit])

# Analytical Dashboard

# Analytical Dashboard

(When user selects the Category on 9.a then show Product wise Sale for the category in the SAME DASHBOARD)

## ❖ Actions added on worksheets and Dashboards:

The screenshot shows the 'Actions' dialog box in Tableau. At the top, it says 'Actions let you create interactive relationships between data, dashboard objects, other worksheets, and the web.' Below that, 'Show actions for' has two options: 'This workbook' (selected) and 'This sheet'. The main area is a table with columns: Name, Run On, Source, and Field. The table lists several actions, with the first one, '\_ Employee\_UnderHoveredManager', highlighted with a yellow border. The actions listed are:

Name	Run On	Source	Field
_ Employee_UnderHoveredManager	Hover	SalesDashboard (V4)	All
Employee Wise Freight	Menu	SalesDashboard (V7)	All
Frm5_to_6	Select	Orders+ (Multiple Co...)	All
FrmV1_goToCategoryDashboard	Select	SalesDashboard (V2)	
GoTO_4(MonthwWiseSales)	Select	CategoryDashboard (...)	All
Ship Country Wise Freight	Menu	SalesDashboard (V7)	All
FrmV1_GoTOProductDashboard	Select	SalesDashboard (V1)	All
ProductWise_sales_forSelectedCategory	Select	AnalyticalDasboard (...)	All

At the bottom, there are buttons for 'Add Action', 'Edit', 'Remove', 'Cancel', and 'OK'.

## ❖ Conclusion:

- 1) Tableau performs actions on your view in a very specific order; this is called the Order of Operations. Filters are executed in the following order:
  - a. Extract filters.
  - b. Data source filters.
  - c. Context filters.
  - d. Filters on dimensions (whether on the Filters shelf or in filter cards in the view)
  - e. Filters on measures (whether on the Filters shelf or in filter cards in the view).
- 2) Filtering is an essential part of analysing data.
